

ADAMAPP

Canadian Retail Chain

A digital platform to prevent, track and report in-store incidents. Our simple tablet app prevents thefts and damages, as well as creating easy stock reports.

Data accuracy

The challenge

Using paper to report thefts, damages and other store incidents takes up valuable employee time and leaves you open to human error and inaccurate data. It's difficult to trace an individual incident, and it can be hard to spot patterns and find useful information to prevent more incidents. Canadian Retail Chain asked us to create an easy-to-use app to replace the paper process and provide a more accurate, time-saving digital solution.

The solution

We developed an iPad app which can be used by in-store teams as well as management, setting different access levels for each user. We used an API to connect the app to the client's systems, creating a seamless process for stock levels, incident reporting and store management.

The app can be used to create detailed reports, including UPC scanning to link items to the report, and an image, video and document upload function to give management the full picture.

Easy management

Aggregate information easily for Head Office reporting

Efficient

Easily prepare reports, with scan and prefill options

In real-time

Create incident reports quickly and easily, as they happen

... Testimonial

"The ADAMAPP team designed a mobile application for loss prevention as requested by our company (a global retail enterprise). They provided great support and were more than willing to adjust their resources to best match our needs. I would like to thank the team for their great support and efforts toward this project delivery."

IT Project Manager, Global Retail Enterprise
